numerical analysis provides the theoretical foundation for the numerical algorithms we rely on to solve a multitude of computational problems in science based on a successful course at oxford university this book covers a wide range of such problems ranging from the approximation of functions and integrals to the approximate solution of algebraic transcendental differential and integral equations throughout the book particular attention is paid to the essential qualities of a numerical algorithm stability accuracy reliability and efficiency the authors go further than simply providing recipes for solving computational problems they carefully analyse the reasons why methods might fail to give accurate answers or why one method might return an answer in seconds while another would take billions of years this book is ideal as a text for students in the second year of a university mathematics course it combines practicality regarding applications with consistently high standards of rigour

mathematics is playing an ever more important role in the physical and biological sciences provoking a blurring of boundaries between scientific disciplines and a resurgence of interest in the modern as well as the classical techniques of applied mathematics this renewal of interest both in research and teaching has led to the establishment of the series texts in applied mathematics the development of new courses is a natural consequence of a high level of excitement on the research frontier as newer techniques such as numerical and symbolic computer systems dynamical systems and chaos mix with and reinforce the traditional methods of applied mathematics thus the purpose of this textbook series is to meet the current and future needs of these advances and to encourage the teaching of new courses we will publish textbooks suitable for use in advanced undergraduate and beginning graduate courses and will complement the applied mathematical sciences series which will focus on advanced textbooks and research level monographs
